For my internship, I have worked as a software development engineer intern at Amazon. I was fortunate enough to be a part of a team that’s full of talented and smart people. Our team is a part of Seller Central and owns the “create” and “edit” page for items listed on amazon.com. It was a very exciting opportunity as I had the chance to work within very large codebases and write code that had meaningful impact at scale. Early on in my internship, I worked on a feature that impacts the way items are priced on amazon.com. For the rest of my internship, I have worked on internal tools to help my team. I’ve worked with multiple programming languages including Java and JavaScript. I’ve also had the chance to write different kinds of tests. I wrote unit tests using Java and JUnit. I also implemented integration tests using JavaScript and nightwatch.js (which has been really exciting). This internship gave me the opportunity to make a difference at a large scale and learn about the culture at Amazon, the most customer-centric company.
