Abstract
For my internship, I worked at the Division of Social Health Services (DSHS) as a front end web developer. My project was to overhaul the existing intranet for the Division of Vocational Rehabilitation (approximately 67 web pages). The goal of this project was to incorporate all the web pages into the newly established source control as well as to make the pages more accessible to disabled users. I did this by migrating all the web pages to a Vue Javascript Nuxt Application. Additionally, I identified all the broken links that needed to be fixed, redesigned the Intranets banner artwork and favicon artwork. At the end of the video I showcase a side by side comparison of the sites while also explaining the project constraints given to me.
