For this project, I decided to try and do something I haven’t tried before a mix of software and hardware project powered by Raspberry Pi. My project consists of three phases, for phase one, I built a Raspberry Pi LAMP stack web server with WordPress. Phase two, I built a media server powered by Media Plex Server powered by Raspberry Pi the media server is used to centrally organize multimedia such as photos, videos, movies, and music, which are accessible to multiple users and devices within a private network. Phase three, I built a smart mirror (Magic Mirror) this mirror has an informational hub and can display the weather forecast, play music, etc.
